INDEPENDENT OPEN-SOURCE CONTRIBUTION · PUBLIC DATA ONLY

EP Research Copilot

A monthly, one-command digest of new AF-ablation literature and registered trials, with evidence pulled from each abstract next to the exact sentence it came from.

What it does

- **Finds new PubMed articles** for a saved, documented query (by PubMed entry date, so nothing indexed between runs is missed); removes duplicates.
- **Sorts them for review** by topic: pulsed-field ablation, recurrence, monitoring, repeat ablation, safety. Nothing is discarded.
- **Extracts from abstracts**: design terms, sample size, interventions, follow-up, outcome statements, effect estimates and p-values, trial IDs and limitations. Each comes with its source sentence.
- **Tracks ClinicalTrials.gov**: what changed since last month (status, enrollment, outcomes, dates, results flag, Washington State sites).

What it does not do

- No systematic review, appraisal or clinical recommendations.
- No full text; abstracts only, labelled as such.
- No patient or institutional data; no login; no paid services.

Status

- 54 automated tests; CI on Python 3.11 to 3.13.
- Sample run on real records: 26 PubMed articles (one week) and 396 tracked trials.
- Screening precision and recall will be measured from reviewer decisions; it is not yet measured.

Try it: `pip install -e . && ep-copilot run` (about 1 minute), then open `output/ep_research_digest.html`. Monthly upkeep: about 30 minutes. New topics are a configuration edit.
