INDEPENDENT OPEN-SOURCE CONTRIBUTION · PUBLIC CMS DATA ONLY

UWMC Quality Signal Monitor

A reproducible report on UW Medical Center's publicly reported HCAHPS patient-experience results, led by discharge and care-transition measures, compared with matched national values after every CMS refresh.

What it does

- **Downloads** the official CMS datasets (HCAHPS Hospital, HCAHPS National, Hospital General Information) and records URLs, dates and checksums.
- **Verifies** facility 500008 by name, city and state before analysing anything.
- **Compares** each measure with the national value only when the measure ID, reporting window and response category all match; otherwise it explains why not.
- **Leads with** discharge information, medicines, care coordination and symptom information; accounts for the 2025 HCAHPS survey update.
- **Lists data issues**: suppression, footnotes, small samples, schema changes.

What it does not do

- No statistical significance claims (CMS publishes no standard errors).
- No causes, quality judgements or clinical recommendations.
- No patient-level data; no access to UW systems.

Status

- 74 automated tests; CI on Python 3.11 to 3.13.
- Real-data report: pending first run on live CMS data; verify before sharing.

Try it: `pip install -e . && uwmc-monitor run --fetch`, then open `output/uwmc_quality_report.html`. Re-run after each CMS refresh; keep earlier downloads to show change over time.
